Demo reel

[YouTube – 20+ gameplay clips](#)

Address

Belarus, open to remote

Expertise

Core

C#, .NET, Unity Engine

Gameplay & Systems:

Gameplay systems, FTUE, localization, Addressables, DOTween, Cinemachine, NavMesh, Coroutines, Async/Await, UniTask, Spine 2D animation integration

Multiplayer

Photon Fusion, PUN2, Nakama

Backend & Integrations

Firebase (Auth, Firestore, Cloud Messaging, Analytics, Crashlytics), REST API, UnityWebRequest, Sentry, OneSignal, Facebook SDK, Google Sign-In, Apple Sign-In

Monetization

Unity IAP, AdMob, Unity Ads

DMITRY VANIUK

C# UNITY DEVELOPER

Unity developer with 5 years in C# and Unity, 4+ of them on commercial releases. Ships live-service products end to end: backend integration (Firebase, Nakama), authentication and FTUE funnels, realtime features, monetization, and performance tuning for low-end devices. Works both as the only engineer on a product and as a systems owner inside a 7-person team. Released on Android, iOS, Steam and WebGL.

Key Achievements

- Shipped 6 commercial products across Android, iOS, Steam and WebGL — solo and in teams of up to 7.
- Owned the live-service client stack of a football card game in a team of 7: FTUE, authentication, realtime leaderboard, Season Pass and push.
- Lifted low-end Android from 15–20 FPS to a stable 30+ and cut build size by ~25%.
- Integrated 15+ third-party SDKs — Firebase suite, Nakama, Photon, AdMob, Unity IAP, Sentry, Thirdweb, YouTube — across shipped titles.

Experience

Mar 2026 – Present

Golfr – [golfr.life](#)

Unity Developer

Golf sports app (iOS) - solo Unity module inside a native Swift app

Technologies: C#, Unity, iOS, Swift interop, custom physics, local multiplayer

- Designed the Swift → Unity bridge that converts real swing telemetry into simulated ball flight, so a physical swing drives the in-game shot.
- Built full golf-rule scoring for 1–4 player pass-and-play: 9-hole progression, scorecards, auto-putts and par × 2 stroke caps — entirely client-side, no server required.
- Implemented terrain-aware ball physics with hazards and penalties, plus cinematic hole flyovers and a shot HUD.

Feb 2025 – Mar 2026

GameDev Studio - [Celadon Soft](#)

Unity Developer

Football 6-7 - [GooglePlay](#) - live-service football card game, team of 7

Technologies: C#, Unity, Nakama, Firebase Firestore, Firebase Auth, Firebase Cloud Messaging, Crashlytics, Facebook SDK, Apple Sign-In, Google Sign-In, OneSignal, Sentry, Unity Localization

- Sole owner of the Firebase backend layer of a live product — Firestore security rules, indexes, access control and per-environment configuration.
- Architected authentication across four providers (Firebase Auth, Facebook, Google, Apple ID) with session persistence and account linking, so players keep progress across devices.
- Shipped the complete FTUE: scripted onboarding that carries a new install through to a first finished match result.
- Delivered the realtime layer on Nakama — match state transitions, in-game chat and a paginated leaderboard with server-side ranking.
- Built the Android/iOS push pipeline with deep links routing a tap straight to the target screen, plus Mail Center CRUD, server-driven Season Pass, Profile/Settings/Ranking UI and the audio and SDK layer (Sentry, OneSignal).

Expertise

Architecture & Tools

SOLID, MVC/MVP, Zenject, Custom Editors, Property Drawers, Unity Assembly Definitions

Performance & Debugging

Unity Profiler, Memory Profiler, mobile optimization, debugging, crash analysis, Unit testing

Platforms & Workflow

Android, iOS, WebGL, PC, Git, GitHub, GitLab, Jira, Cursor IDE

AI & Tooling

Cursor agents, Unity MCP, AI-assisted refactoring

Education

2015 - 2020

Bachelor of Engineering – Automation Engineer

Vitebsk State Technological University

Language

English

Russian

Belarusian

Experience

Jul 2022 – Feb 2025

Freelance / Contract

Unity Developer

Clients: Umdpersum, Haki Games, Ravencliff Games, Mintton

Fight of Castles - [GooglePlay](#) - Android strategy, solo development, client: **Haki Games**

Technologies: C#, Unity, Firebase Analytics, AdMob, UniTask, Android

- Raised low-end Android from 15–20 FPS to a stable 30+ via LOD for 3D meshes, core refactoring and moving heavy work to UniTask async.
- Eliminated memory leaks found with Unity Memory Profiler and cut build size by ~25% by reworking scene loading into async flows.
- Implemented A* pathfinding for enemy AI and integrated Firebase Analytics and AdMob.

The Hidden Library - [Steam](#) - story-driven point-and-click, team project, client: **Ravencliff Games**

Technologies: C#, Unity, Spine 2D, PC (Steam)

- Built the core gameplay foundation reused across the whole game: interaction, inventory, scene flow and progression.
- Designed and shipped 4 story levels from blockout to release, plus a set of standalone story-driven mini-games.
- Integrated Spine 2D character and environment animation into the production pipeline.

Event Controller App - [GooglePlay](#) / [App Store](#) - live-event control app, solo, via **Umdpersum**

Technologies: C#, Unity, REST API, YouTube SDK, iOS, Android, Windows

- Built solo a live-event remote control app: attendees join a host Windows PC by QR code and drive media playback in real time.
- Shipped one codebase across 3 platforms with unified file management and byte-array sync for multi-device content distribution.

NFT Holders - [Mintton.io](#) / [YouTube \(Demo\)](#) - Web3 card/casino game, WebGL, team project, client: **Mintton**

Technologies: C#, Unity, WebGL, Thirdweb SDK

- Refactored a legacy WebGL codebase and resolved critical inherited gameplay defects.
- Implemented server-driven win combinations with correct prize allocation and Thirdweb wallet authentication.

Aug 2021 – Jul 2022

School of Programming & Robotics

Lecturer → Senior Lecturer

- Taught C#, C++, HTML/CSS and Unity game development to students aged 8–15, up to 12 per session.
- Promoted to Senior Lecturer after six months for teaching quality and student results.
